

OPEN SOURCE · AIR-GAPPED

Your network changes, preflighted in a digital twin.

Forward Predict and NetPilot are cloud-by-architecture.
Regulated networks legally can't send configs off-prem.

**AEGIS runs the same loop — entirely inside
your perimeter. No cloud. No egress. Ever.**

change → twin → validate → sealed evidence

AEGIS · github.com/gesh75/aegis

HOW IT WORKS

LLM proposes. Pipeline verifies.

- 1 Describe the change in plain English
- 2 Self-hosted LLM drafts vendor configs
- 3 Batfish static analysis
- 4 containerlab digital twin — real convergence
- 5 Diff: routes, BGP sessions, blast radius
- 6 Verdict: ship_ready / blocked + rollback plan

Only step 2 touches the LLM.

Everything after is deterministic.

NEW IN 0.2

11 compliance frameworks. Mapped automatically.

NIST 800-53 · 800-171 · CSF 2.0

PCI DSS v4 · SOC 2 · HIPAA · ISO 27001

CIS v8 · DISA STIG · NERC CIP · IEC 62443

Every control cites its evidence:

config-checked, twin-tested, or process-mapped —
never asserted without proof.

EVIDENCE-GRADE MEANS

If it isn't proven, it says so.

- ✗ Old: "verified in digital twin" — asserted always
- ✓ New: claims gate on a recorded, converged twin run
- ✓ No twin? Control reports `not_applicable` — honestly
- ✓ Tampered bundle → PDF endpoint rejects it (422)
- ✓ Ed25519-sealed: verify any bundle offline
- ✓ Invalid signing key → server refuses to start

BUILT WITH AI · VERIFIED BY AI

Reviewed by a 16-agent adversarial swarm.

4 review lenses: security, quality, compliance
domain-correctness, API/UI surface

Every HIGH finding adversarially re-verified

Caught before any auditor could:

- a BGP parser overcounting Established peers
- a PCI control labeled 8.3.1 instead of 8.3.2
- compliance claims unbacked by twin evidence

NUMBERS

Tested like it guards production.

25,000-run stress test · 0 invariant violations

85 compliance checks across 11 frameworks

76 tests green in CI on every push

Every button + endpoint driven via browser automation

Apache 2.0 · Python · Flask · containerlab

Runs fully offline — docker compose up

TRY IT

Preflight your next change before the network feels it.
